

# Indian Institute of Information Technology Sri City

## Computer Programming

### Introduction to Programming

Instructor(UG-1/Sec-3)

**Dr. Balasubramanian (Subu) Kandaswamy**

**Dr. Bheemappa Halavar**

Core Course

12/8/2020

Computer Programming | IIITS  
[www.tiny.cc/bhh](http://www.tiny.cc/bhh)

# Outline

- Introduction to Programming
- Procedural Programming
- Programming Languages

# Introduction to Programming

---

- “ A computer is an electronic data processing device, which accepts and stores data input, processes the data input, and generates the output in a required format.”
- **Programming** is the **process** of writing a **set instructions** for computer to perform certain tasks.

**Programming** can be done using a variety of **computer programming languages**

**Computer program** is sequence of instructions to solve the problem or carry out the task

# Methods of Programming

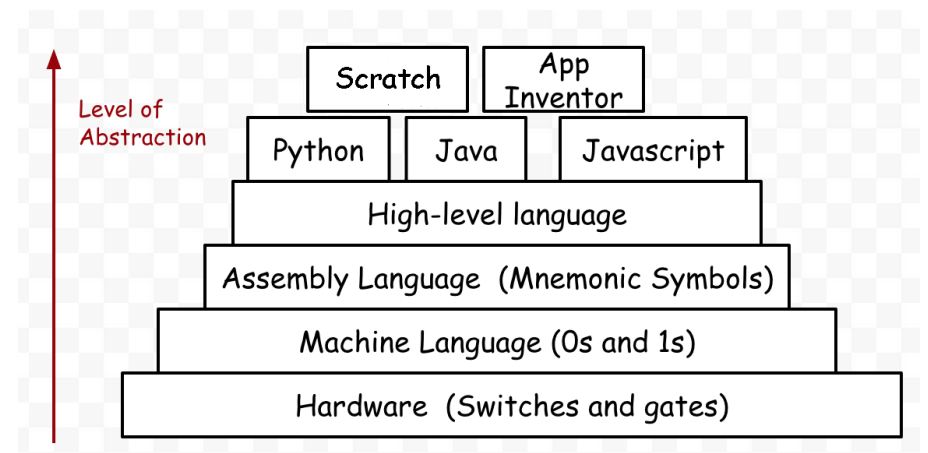

---

- Procedural Programming
  - Defining set of steps to transform inputs into outputs
  - Translating steps into code
  - Constructed as a set of procedures
  - Each procedure is a set of instructions
- Object-Oriented
  - Defining/utilizing objects to represent real-world entities that work together to solve problem
  - Basic O-O Programming Components
    - Class • Object/Instance • Properties • Methods

# Computer Programming Languages

---

- Machine languages (Binary Bits)
  - Often written in binary strings
  - Consisting of 0s and 1s (also called bits).
- Assembly language
  - Unique to a specific computer design
  - Instructions are written in symbolic statements instead of binary
- High-level languages
  - Use English-like commands
  - Easier than writing programs in machine language or in assembly language
  - These languages include C, C++, C#, and Java

## ***Program***

## ***Program in machine language***

|           |          |          |                             |

# ***Program***

# ***Program in C language***

```
1  /* This program reads two integer numbers from the
2     keyboard and prints their sum.
3  */
4  #include<stdio.h>
5
6  int main()
7  {
8     // define variables
9     int a, b, c;
10    // read input numbers
11    printf("Enter two numbers to add\n");
12    scanf("%d%d",&a,&b);
13    // add numbers
14    c = a + b;
15    // print result
16    printf("Sum of the entered numbers = %d\n",c);
17    return 0;
18 }
```

# Evolution of computer languages

# Procedural language

- A **procedural (imperative) language** is a set of instructions that are executed one by one from beginning to end unless an instruction forces the control elsewhere.
  - FORTRAN
  - COBOL
  - Pascal
  - C
  - Ada

# FORTRAN

- FORTRAN: FORmula TRANslation
  - Designed by a group of IBM engineers (1957)
  - The first high-level language
  - Features:
    - High-precision arithmetic
    - Capability of handling complex numbers
    - Exponentiation computation ( $a^b$ )

# COBOL

- COBOL: COmmon Business-Oriented language
  - Designed by Grace Hopper group
  - A business programming language
  - Features:
    - Fast [access](#) to files and databases
    - Fast [updating](#) of files and databases
    - Large amounts of generated [reports](#)
    - [User-friendly](#) formatted output

# Pascal

- Pascal
  - Invented by Niklaus Wirth (1971)
  - Pascal was designed ---
    - To **teach** programming to novices by emphasizing the **structured programming** approach
  - Pascal became the most popular language in academic

# C

- C
  - Developed by Dennis Ritchie at Bell Laboratories (1970s)
  - Most of the UNIX operating system is written in C
  - Features:
    - C has all the high-level instructions
    - C has some low-level instructions
    - C is a very efficient language; its instructions are short
    - C has been standardized by ANSI and ISO

# Object-Oriented languages

- In object-oriented programming, the objects and the operations to be applied to them are tied together.
- The objects in object-oriented programming are active.
  - C++
  - Java

# C++

- C++: developed by Bjarne Stroustrup at Bell Lab
- Three principles:
  - Encapsulation
    - The user knows what to do with the data without knowing how it is done.
  - Inheritance
    - When a general class is defined, you can define a more specific class that inherits some of the characteristics of the general class but also has some new characteristics.
  - Polymorphism
    - You can define several operations with the same name that can do different things in related classes.

# Java

- Java:
  - Developed at Sun Microsystems,, Inc.
  - The language is totally class oriented.
  - Every data item belongs to a class.
  - The browser can download the [applet](#) and run it [locally](#).
  - Features:
    - Class library
    - Multithreading

# Building a program

- Three steps to building a program:
  - Writing an editing the program
    - Using text editor to edit the [source file](#)
  - Compiling the program
    - Two programs: the [preprocessor](#) and the [translator](#)
  - Linking the program with the required library modules
    - The linker assembles all of the [subprograms](#) into the final executable program

# Introduction to compiler
